Data Platform Programme

Business Domain Register

Step 1 Deliverable — Business Domain Identification

Version 1.3 — 10 Source Systems. Procurement Supplier Contracts in PDF added.

Document ID	BDR-001
Version	1.3 — Source System Correction
Date	24 August 2026
Author	Thozamile Mbalo — Data Solutions Architect
Reviewed by	Nomvula Mahlangu — Chief Data Officer
Status	Approved v1.2 — v1.3 Pending CDO Sign-off

Version 1.2 Changes — Summary

- 1. Marketing identified as a sixth business domain following CCO stakeholder interview (Step 2).
- 2. Customer Loyalty domain boundary refined — retention focus only. Acquisition and campaign execution reassigned to Marketing domain.
- 3. Three new source systems added to domain map: Salesforce Marketing Cloud, Meta Business Manager, Google Analytics 4.
- 4. Domain ownership formally assigned: Marketing → Rethabile Sithole (CCO). Customer Loyalty → Priya Naidoo (Head of CRM).
- 5. ADR-006 (Marketing Attribution Logic) added to ADR register as a result of this version.

1. Purpose

This document defines the Business Domain Register for the RetailSphere (Pty) Ltd Data Platform Programme. Version 1.2 supersedes version 1.1 (CDO-reviewed) and incorporates findings from the Step 2 Business Process Analysis stakeholder interviews. The domain map has been expanded from five to six domains following identification of Marketing as a distinct business domain with its own processes, data sources, rules, and stakeholder ownership.

2. Version History and Rationale

The domain map evolved through a structured discovery process. Version 1.0 established five domains through value chain analysis. Version 1.1 incorporated CDO review comments. Version 1.2 reflects a material change to domain structure identified during stakeholder interviews in Step 2.

2.1 Why Marketing was added as a sixth domain

During the CCO stakeholder interview (Rethabile Sithole), three source systems were identified that were absent from BDR-001 v1.0: Salesforce Marketing Cloud, Meta Business Manager, and Google Analytics 4. These systems support a business process — customer acquisition, campaign execution, and closed-loop attribution — that is distinct from both Sales (which records transactions) and Customer Loyalty (which manages retention).

Applying the four-criteria domain test confirmed Marketing as a separate domain:

1. Distinct process: Campaign execution and customer acquisition — orientation toward new and lapsed customers, not existing loyalty members.
2. Own data: Campaign send records, engagement data (opens, clicks), anonymous prospect data, and attribution signals. None of this exists in CRM or POS.
3. Own rules: Attribution window definitions, spend allocation logic, acquisition cost measurement, segment conversion targeting.
4. Own stakeholders: Rethabile Sithole (CCO) owns acquisition and campaign performance. Priya Naidoo (Head of CRM) owns retention and loyalty management. These are formally separate ownership lines as of this version.

2.2 Why Customer Loyalty boundary was refined

Version 1.0 Customer Loyalty included all Salesforce CRM activity. Version 1.2 restricts Customer Loyalty to retention processes only — member management, rewards, churn prevention, and loyalty tier management. Campaign execution and acquisition activity, while operationally delivered through Salesforce Marketing Cloud, are governed by different business rules, measured by different KPIs, and owned by a different stakeholder. Combining them in a single domain would obscure accountability and produce conflicting metrics in the Gold layer.

3. Business Domain Register — Version 1.2

Domains marked ★ NEW were added in version 1.2. Domains marked ◆ REVISED had their boundary definitions updated. All other domains are unchanged from version 1.1.

Domain	Business Process	Source Systems	Cross-cutting Risk	Risk
Procurement	Supplier management, purchase order creation, goods receipt, invoice processing and supplier payment.	<i>SAP ECC 6.0</i>	SAP single point of failure across three domains. File-extract-only integration limits real-time data availability. Supplier contracts stored as PDFs — unstructured data extraction required.	HIGH
Inventory Management	Stock receipts, inter-location movements, replenishment triggers, real-time shelf availability and shrinkage tracking.	<i>SAP ECC 6.0 Oracle MICROS POS</i>	SAP single point of failure. POS schema varies per store (87 databases). Replenishment trigger based on unreliable stock position — structural data integrity risk (see BPA Finding 001).	HIGH

Domain	Business Process	Source Systems	Cross-cutting Risk	Risk
Sales	In-store and online product transactions, returns processing, customer-linked sales capture across all channels.	Oracle MICROS POS Shopify Plus Salesforce CRM	No master product ID. No unified customer ID. 66% of in-store transactions anonymous. Attribution gap between campaign touchpoint and transaction.	HIGH
Customer Loyalty ♦ REVISED	Loyalty member enrolment and management, rewards accrual and redemption, customer retention and churn prevention. BOUNDARY REFINED v1.2: Retention focus only. Acquisition and campaign execution moved to Marketing domain.	Salesforce CRM	No unified customer ID links loyalty members to POS transactions or Shopify orders. 2.1M member records without cross-system resolution. POPIA compliance required for identity matching.	HIGH
Finance	General ledger management, cost centre accounting, month-end close, financial reporting and regulatory compliance.	SAP ECC 6.0 Excel (140 workbooks — decommission target)	SAP single point of failure. Excel workbooks represent uncontrolled data — highest financial reporting risk. Legacy DW decommission milestone required by Q3 2026 (CDO instruction).	HIGH
Marketing ★ NEW	Customer acquisition, campaign execution and measurement, paid media management, closed-loop attribution across all channels. NEW DOMAIN v1.2: Identified during CCO stakeholder interview.	Salesforce Marketing Cloud Meta Business Manager Google Analytics 4	No common campaign identifier across three systems. Double and triple attribution counting likely. Attribution data does not exist in any source system — created for first time by data platform. ADR-006 required before build.	HIGH

★ NEW = Added in v1.2. ♦ REVISED = Boundary definition updated in v1.2. All domains rated HIGH risk due to source system integration complexity.

4. Updated Source System to Domain Dependency Map

Version 1.3 adds one new source systems. Identified during Step 5 (SSI-001) investigation.

Source System	Procurement	Inventory	Sales	Cust. Loyalty	Finance	Marketing ★
SAP ECC 6.0	✓	✓			✓	
Oracle MICROS POS		✓	✓			
Shopify Plus			✓			
Salesforce CRM			✓	✓		

Source System	Procurement	Inventory	Sales	Cust. Loyalty	Finance	Marketing ★
Salesforce Mktg Cloud						✓
Meta Business Manager						✓
Google Analytics 4						✓
SQL Server Legacy DW						
Excel Workbooks					✓	
Supplier Contract PDFs ★	✓					

★ = Added in v1.3. Identified during Step 5 (SSI-001) investigation, following the Sipho Dlamini procurement interview — postdates BDR-001 v1.2's sign-off (17 April 2026) by approximately six weeks. Feeds contracted rates, lead times, and payment terms via ADR-003 PDF extraction. Backported here to bring BDR-001's dependency map in line with SSI-001's confirmed 10-system scope.

5. Critical Cross-cutting Problems — Updated

The cross-cutting problems identified in v1.0 remain unresolved and are now compounded by the Marketing domain addition. Version 1.2 adds a third cross-cutting problem.

5.1 No Master Product Identifier — Unchanged

Problem: SAP stock code ≠ Oracle MICROS POS code ≠ Shopify SKU

Domains affected: Procurement, Inventory Management, Sales

Architecture response: ADR-001 — Master Product Identifier Strategy (pending)

5.2 No Unified Customer Identifier — Scope Expanded

Problem: Salesforce Loyalty ID ≠ Shopify Customer ID ≠ POS receipt ≠ Marketing Cloud contact ID ≠ Meta pixel ID ≠ GA4 client ID

Domains affected: Sales, Customer Loyalty, Marketing

v1.2 expansion: Marketing domain adds three additional anonymous identifiers. 66% of in-store transactions are anonymous — these customers cannot be linked to any campaign or loyalty record.

Architecture response: ADR-002 — Unified Customer Identity Resolution. Scope expanded to include segment classification and anonymous customer handling.

5.3 No Marketing Attribution Source of Truth — NEW in v1.2

Problem: Attribution data does not exist in any source system. It must be created by the data platform for the first time.

Domains affected: Marketing, Sales, Customer Loyalty

Impact: RetailSphere currently spends R8.3 million annually on marketing with no reliable closed-loop attribution. Each of the three marketing systems (Marketing Cloud, Meta, GA4) applies its own attribution model, resulting in double and triple counting of conversions.

Architecture response: ADR-006 — Marketing Attribution Logic and Methodology. Attribution window definition must be agreed with CCO before platform build.

6. Domain Ownership Register

Version 1.2 formally documents domain ownership following stakeholder interview findings. Ownership determines who signs off on domain requirements, reviews dimensional model designs, and accepts Gold layer outputs.

Domain	Process Owner	Title	Ownership Scope
Procurement	Sipho Dlamini	Head of Procurement	Supplier management, PO process, goods receipt, invoice matching, payment terms
Inventory Management	Zanele Mokoena	National Inventory Manager	Stock movements, replenishment, shrinkage, store inventory position
Sales	Rethabile Sithole	Chief Commercial Officer	In-store and online transactions, channel performance, revenue reporting
Customer Loyalty	Priya Naidoo	Head of CRM & Loyalty	RETENTION ONLY: Member management, rewards, churn prevention, loyalty tiers
Finance	Johan van der Merwe	Group Financial Controller	General ledger, cost centres, month-end close, financial reporting (interview pending)
Marketing	Rethabile Sithole	Chief Commercial Officer	ACQUISITION: Campaign execution, paid media, attribution, segment conversion

7. Next Steps

1. CDO sign-off on v1.2 domain map — six domains, updated ownership register.
2. Complete remaining Step 2 interviews — Priya Naidoo (Customer Loyalty) and Johan van der Merwe (Finance).
3. Produce BPA-001 Business Process Analysis Report — all five domain interviews.
4. Initiate ADR-001 through ADR-006 formal write-up — Step 6 Risk Analysis.
5. Communicate Marketing domain boundary to Priya Naidoo — clarify retention vs acquisition ownership split.

8. Document Change Log

Version	Date	Author	Description
1.0	14 April 2026	T. Mbalo	Initial document. Five domains identified, source system mapping completed, cross-cutting risks documented.
1.1	14 April 2026	N. Mahlangu (CDO)	CDO review. Two comments: Legacy DW decommission to Step 6 Risk Register. ADR-002 to specify matching strategy with POPIA legal dependency.
1.2	17 April 2026	T. Mbalo	Domain expansion following Step 2 stakeholder interviews. Marketing added as sixth domain. Customer Loyalty boundary refined to retention only. Three new source systems added. ADR-006 triggered.
1.3	24 August 2026	T. Mbalo	Added Supplier Contract PDFs to the source system dependency map (section 4) — 10th source system, discovered during Step 5 (SSI-001) investigation after v1.2 sign-off. Feeds Procurement domain via ADR-003. Corrects a discrepancy where BDR-001's dependency map showed only 9 systems against SSI-001's confirmed 10.
